

## Creation of the parameter

Firstly I need to go to Property Manager to add new Parameter, which will be showed in all objects.

I've created new Group of properties called "Uncertainty" and I added to it property called "Level".

I've added short description of the parameter and I've set the data type to the "Option set". This type of data allows to prepare the list of possible values, which user can pick from the list.

Property Manager

Name	Type	Default
<b>Identification</b>		
Wikidata	String	https://www.wikidat...
Wikipedia	String	https://www.wikiped...
<b>Uncertainty</b>		
Level	Option Set	0 - not taken into c...

Property Name: Level

Description: Level of uncertainty according to the scale developed by Irene Cazzaro (0-4)

**VALUE DEFINITION**

Data Type: Option Set

Default Value: ☐ Undefined ☒ Value ☐ Expression

Options Setup...

Value: 0 - not taken into consideration

Sequence

Add... Remove Edit... Evaluate...

**AVAILABILITY FOR CLASSIFICATIONS**

Cancel OK

I put all the possible values to the option set according to the provided uncertainty scale.

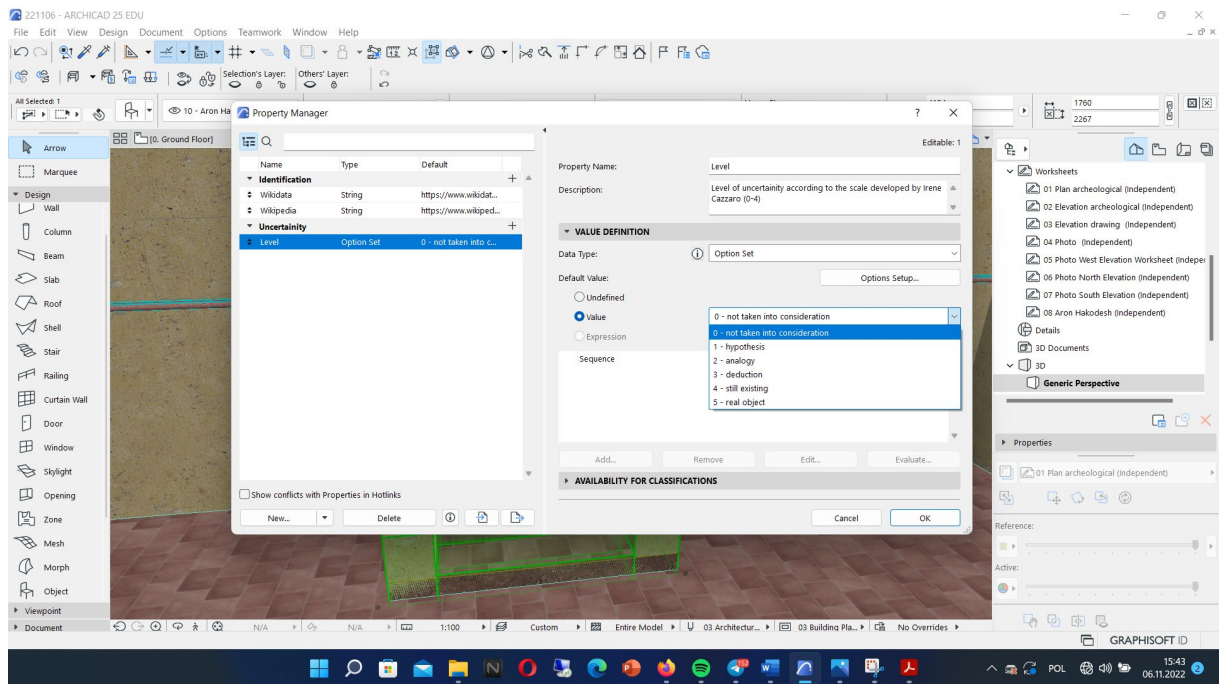

Options Setup

Value

- 0 - not taken into consideration
- 1 - hypothesis
- 2 - analogy
- 3 - deduction
- 4 - still existing
- 5 - real object

Add Remove ☐ Allow multiple choices

Cancel OK

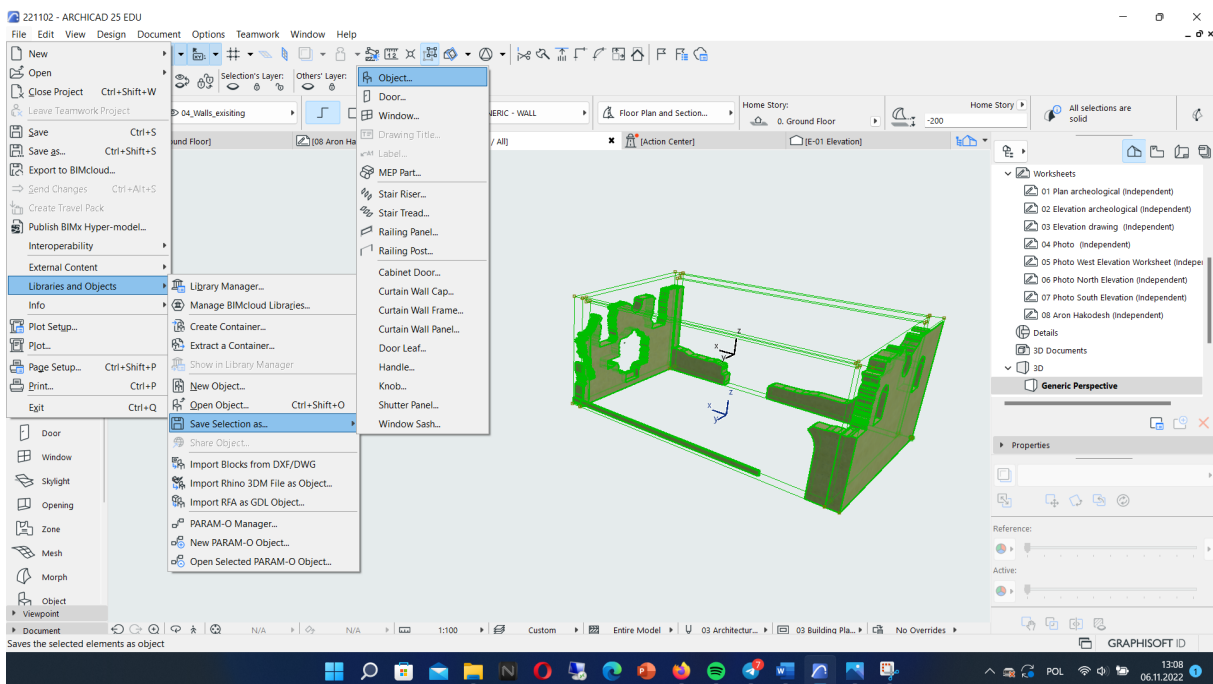

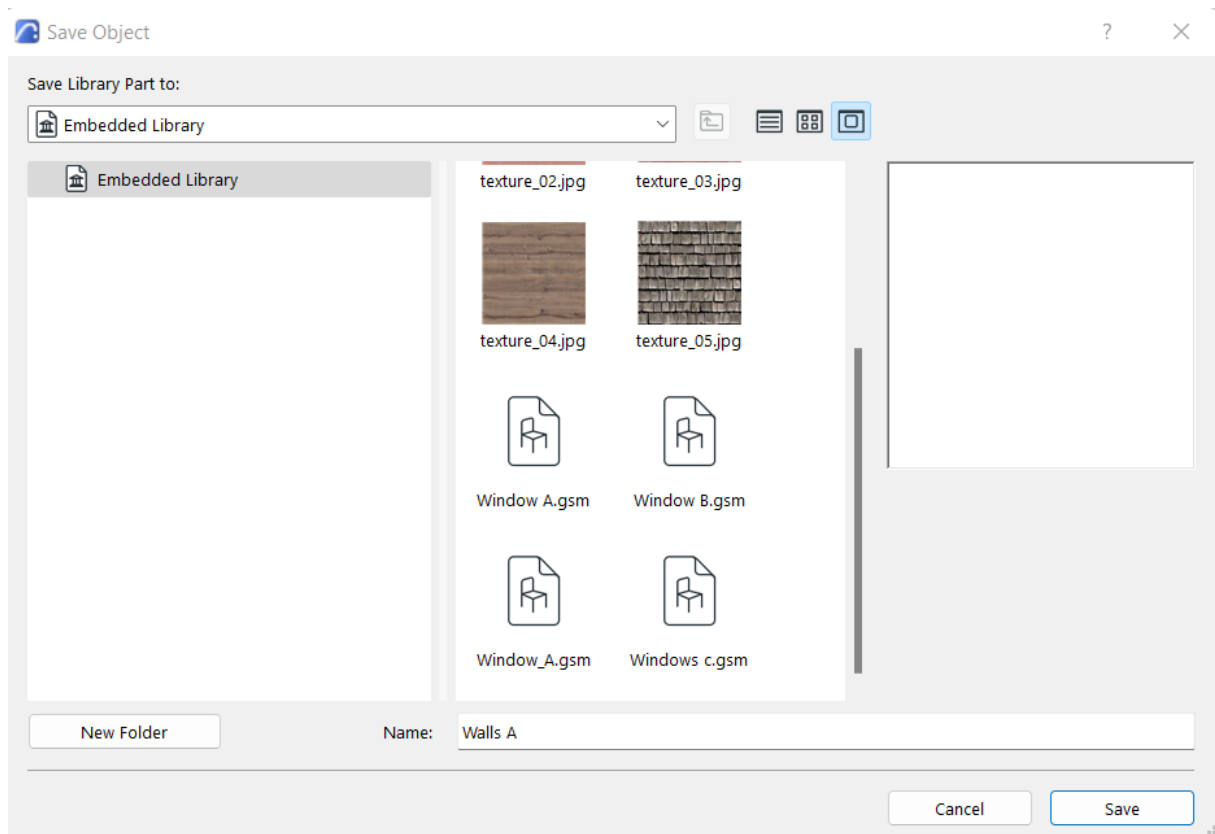

## Creation of complex objects

Some objects needed to be saved as one even if they were created from several components. For instance, all walls should be considered as one object. They are just divided into parts, which are still existing and parts, which are reconstructed. After creation of right shapes (with use of "Solid Element Operation") I received four wall reliefs.

To create one object from them I needed to go to select all of them and save them as an object in internal project library:

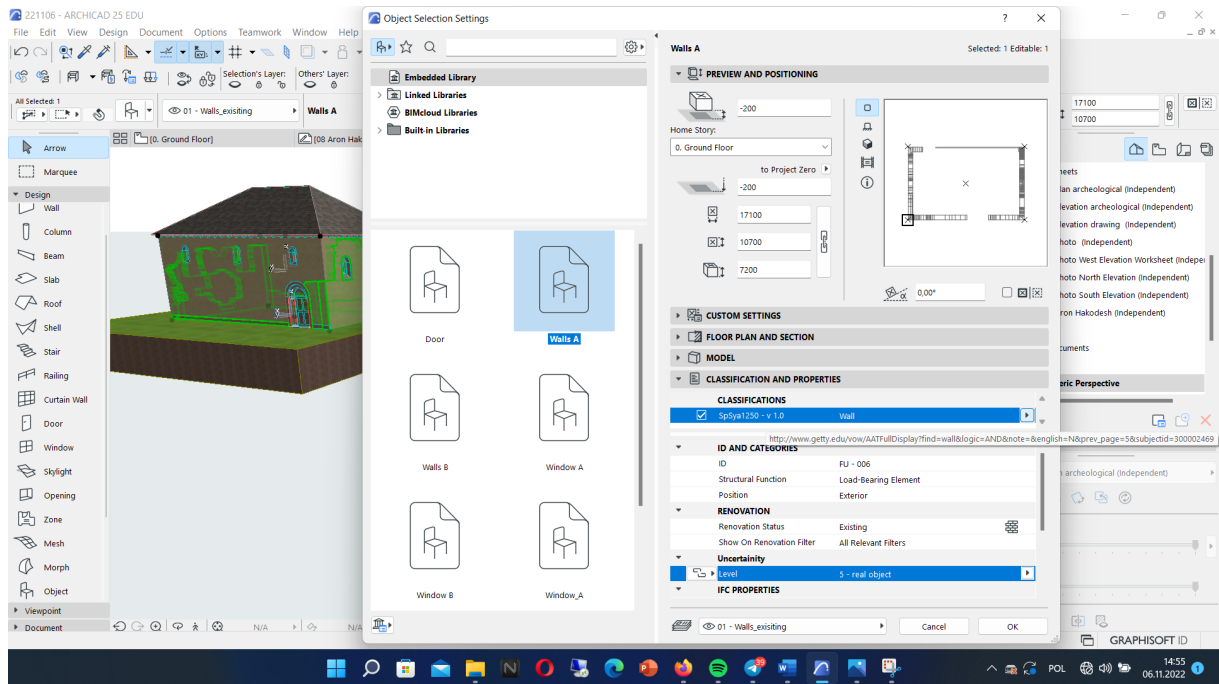

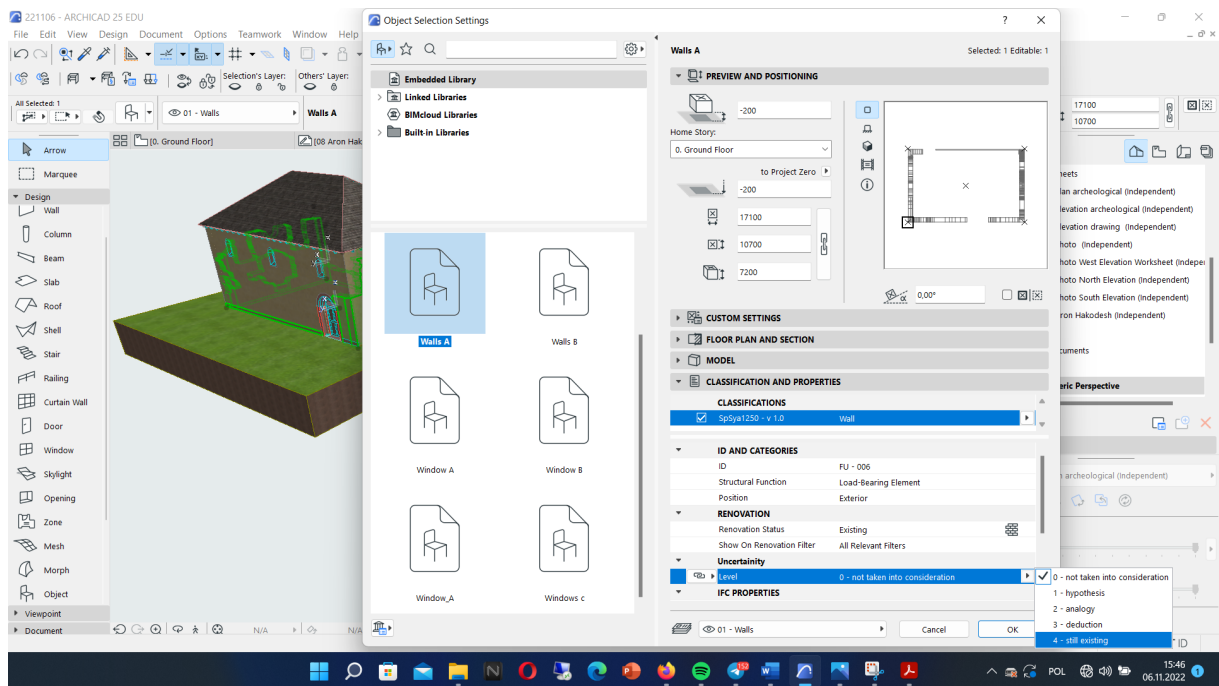

Then original walls were moved to the side and object “Wall A” was placed in the right position:

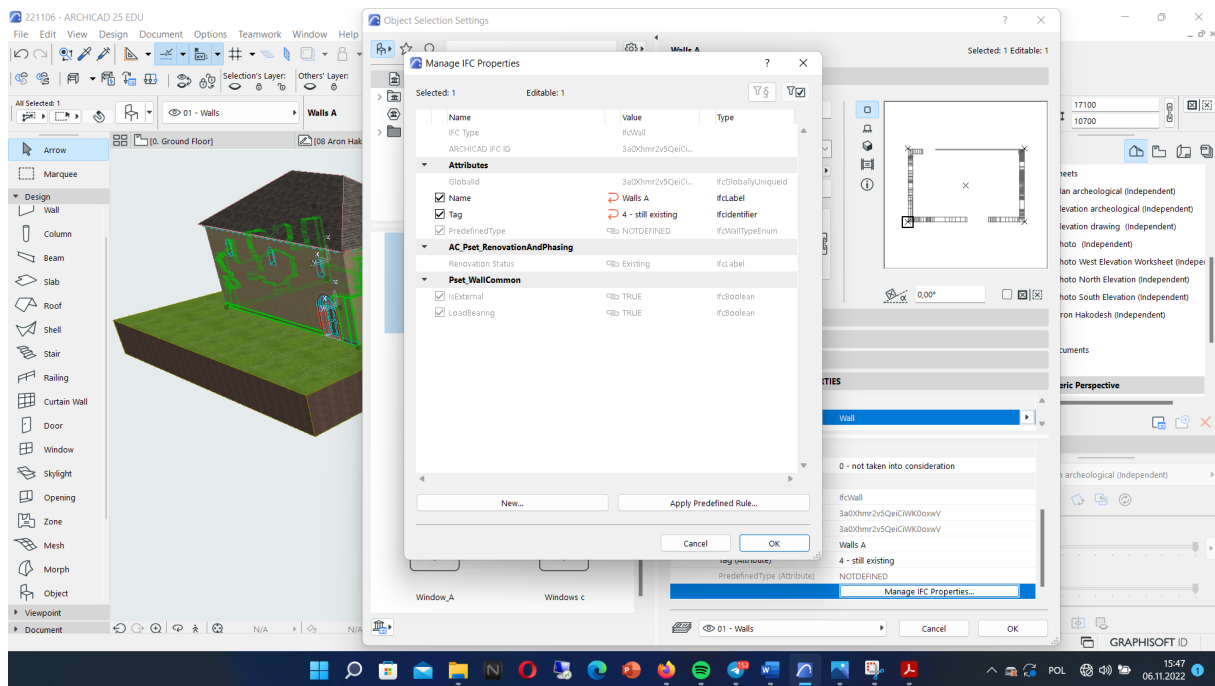

Then I changed properties of the object under the “CLASSIFICATION AND PROPERTIES” section. The process I will explain on the example of the object “Wall A”. In “CLASSIFICATION” I picked hierarchy prepared for this project called “SpSya1250 - v1.0”. I picked class “wall” from the hierarchy.

Then in uncertainty section I picked the right level from the list:

The last part was to adjust the IFC export information. I've entered "IFC PROPERTIES" section and I've changed the "Name" attribute to "Walls A" and "Tag" attribute to "4 – still existing".

The IFC options weren't investigate in deep and it is possible that deeper there is a potential to use IFC standard options for further research and investigation. After opening the IFC export in Open IFC Viewer the uncertainty parameter is still accessible.
